MEMORANDUM

Date: 02/06/08

To: Lollie Driulini
Social Security Administration

From: Rick Prieto
SSA Facilities Team Dallas, TX

Subject: Initial Asbestos Inspection Report for The Bartlesville, OK SSA District Office

Attached is a copy of the U.S. Public Health Service's (PHS) Initial Asbestos Inspection Report for the SSA office located at 300 Leisure Lane, Bartlesville, OK 74006 . Laboratory analytical results indicated that asbestos was not detected in any of the building materials sampled during this inspection. As a result no further action is necessary. A copy of this report should be saved as long as necessary to document this inspection.

If you have any questions, please call me at 214-767-3104 in Management and Operations Support.

Thank You,

Rick Prieto

SUBJECT: Asbestos Inspection Reports--Information

Attached is a copy of the U.S. Public Health Services' Asbestos Inspection Reports for the SSA Field Office (794) located 300 Leisure Lane, Bartlesville, Oklahoma 74006. We have reviewed this report and concur with its findings. No asbestos containing materials were identified at this office.

Please forward a copy of the Asbestos Inspection Report to your regional labor management representative for distribution to the Union health and safety representative for distribution to the lessor. Should this office relocate or acquire additional space in the future, contact our office so we can issue the appropriate asbestos assessments.

If you have any questions or need additional information concerning this document, please contact Kelly Fields at 410-594-2336 or Kim Burket at 410-966-1787. If you have any other environmental concerns, please contact out **Environmental Hotline** on 410-966-1568.

A. EXECUTIVE SUMMARY

On July 23, 2007, Manesh Patel, accredited asbestos inspector representing the U.S. Public Health Service Federal Occupational Health, conducted an initial asbestos inspection at the Bartlesville Field Office (Social Security Administration Code 794, GSA building number OK1309) located at 300 Leisure Lane in Bartlesville, OK 74006. The asbestos inspection included the visual examination of all Social Security Administration occupied spaces, mechanical spaces serving the SSA office, bulk sampling suspect materials, and analysis of suspected asbestos-containing building materials identified at the facility. Eleven building materials suspected of containing asbestos were identified that included: ceiling tile, wallboard, joint compound, ceiling/wall texture, wall vinyl base cove and associated adhesive, carpet adhesive, floor tile and associated adhesive, caulking, and sink coating. Thirty-nine bulk samples of building materials suspected to contain asbestos were collected during this asbestos inspection. One of the bulk samples was multi-layered. A total of forty bulk materials were analyzed. The Federal Occupational Health National Environmental Reference Laboratory in Denver, Colorado analyzed samples for asbestos using polarized light microscopy.

Laboratory analytical results indicated that asbestos was not detected in any of the building materials sampled during this inspection. No further action is necessary.

B. INTRODUCTION

On July 23, 2007, Manesh Patel, accredited asbestos inspector representing the U.S. Public Health Service-Federal Occupational Health, conducted an initial asbestos inspection at the Bartlesville Field Office (Social Security Administration Code 794, GSA building number OK1309) located at 300 Leisure Lane in Bartlesville, OK 74006. The survey included inspection of all SAA occupied spaces in the building and the mechanical spaces serving the SSA office. Prior to the survey, the floor plans were reviewed.

The Bartlesville Field Office occupies a single-story building. Construction of the building was completed in February 2001. The Bartlesville Field Office occupies approximately 4,800 square feet. The exterior walls are brick. The interior walls are wallboard, vinyl covering, ceramic or texture. The floors are finished with carpet tiles, vinyl resilient tile, or ceramic tile. Ceilings are texture wallboard or a suspended metal-grid with lay-in white panels. The Bartlesville Field Office employs approximately nine people. The building has central air conditioning and heating using a system of ductwork to distribute the supply air to the office areas and a ducted return. All SSA occupied spaces were inspected during the survey including the following rooms or areas: entry vestibule area, reception area, public men's restroom, public women's restroom, private interview room, employee women's restroom, employee men's restroom, janitor's room, coat closet area, manager's room, storage room, ADP room, multi-purpose room, open work area, and electrical room.

Before conducting the survey, an opening conference was conducted with Charles Christensen (Office Manager), to discuss the purpose and procedures of the survey. The union representative (Ralph DeJuliis) chose not to attend the opening conference or observe the initial inspection.

Eleven building materials suspected of containing asbestos were identified that included: ceiling tile, wallboard, joint compound, ceiling/wall texture, wall vinyl base cove and associated adhesive, carpet adhesive, floor tile and associated adhesive, caulking, and sink coating. Thirty-nine bulk samples of suspected asbestos-containing building materials were collected during the asbestos inspection. One of the bulk samples was multi-layered. A total of forty bulk materials were analyzed. Samples were analyzed for asbestos using polarized light microscopy by the Federal Occupational Health National Environmental Reference Laboratory in Denver, Colorado.

Laboratory analytical results indicated that asbestos was not detected in any of the building materials sampled during this inspection.

C. METHODS

The survey of the facility was performed according to the Social Security Administration's protocol and 40 CFR Part 763 Subpart E (Asbestos-Containing Materials in Schools). This survey also complied with other federal standards and regulations, including those of the Occupational Safety and Health Administration and the Environmental Protection Agency.

Building materials of the same type were grouped building-wide and sampled using a random sampling plan. No outdoor building material samples were collected during this inspection. The samples of the materials were collected after office hours. Sample collection was minimally destructive and samples were collected from inconspicuous areas. The suspect material was thoroughly wetted and all layers of the suspect material were penetrated when taking samples. Samples were placed in sealed containers or bags. After sealing the container, the container surface was wet-wiped. All samples were assigned an identifier as required by Social Security Administration protocol. The floor plan included in this report indicates the locations from which these samples were obtained.

Samples were analyzed by polarized light microscopy in compliance with guidelines established by the Environmental Protection Agency in its Method for the Determination of Asbestos in Bulk Building Materials (EPA-600/R-93-116) at the U.S. Public Health Service-Federal Occupational Health laboratory in Denver, Colorado. The U.S. Public Health Service-Federal Occupational Health laboratory is currently accredited for bulk asbestos analysis by the National Voluntary Laboratory Accreditation Program of the National Institute of Standards and Technology. Materials were considered to contain asbestos if the sample showed a concentration of asbestos greater than one percent.

The laboratory analysis report indicates a different sample description color of the floor tile from the color indicated on the chain of custody. The color perceptions in the table relate more to the exterior appearance of the material if it is to be easily identified on site, whereas the color descriptions from the laboratory report refer to the color as it appeared on the microscope sample after preparation for analysis. Any confusion regarding referred material may be removed by looking more closely at material location and sample numbers. Color descriptions may vary with variation in lighting conditions and individual perception.

The sample numbered 06-0794-A032B was split into two separate samples by the laboratory. This sample of the carpet adhesive and carpet pad was split simply because the materials are difficult to separate during sampling. The laboratory separated the carpet adhesive and carpet pad during sample preparation and analyzed these two materials individually.

D. RESULTS

Eleven building materials suspected of containing asbestos were identified that included: ceiling tile, wallboard, joint compound, ceiling/wall texture, wall vinyl base cove and associated adhesive, carpet adhesive, floor tile and associated adhesive, caulking, and sink coating. Thirty-nine bulk samples of suspected asbestos-containing building materials were collected during the asbestos inspection. One of the bulk samples was multi-layered. A total of forty bulk materials were analyzed. Samples were analyzed for asbestos using polarized light microscopy by the Federal Occupational Health National Environmental Reference Laboratory in Denver, Colorado.

Laboratory analytical results indicated that asbestos was not detected in any of the building materials sampled during this inspection.

E. DISCUSSION AND RECOMMENDATIONS

No asbestos containing building materials were identified during this inspection therefore no recommendations are needed. No further action is necessary.

F. SUPPORTING DOCUMENTS

Alex Fontenarosa
Federal Occupational Health
1301 Young Street, Suite 772
Dallas, TX 75202

Dear Mr. Fontenarosa:

Enclosed are the results of the analysis of 40 bulk materials from Social Security Administration field office 794, Bartlesville OK, submitted to the Division of Federal Occupational Health (DFOH) National Environmental Reference Laboratory (NERL) Asbestos/Fine Particle Analytical Division in Denver, Colorado, for asbestos analysis. These samples were received at NERL on August 2, 2007. The methods used for this evaluation involve stereo- and polarized-light microscopy (PLM) in compliance with guidelines established by EPA in its Method For The Determination Of Asbestos In Bulk Building Materials (EPA-600/R-93-116). The DFOH laboratory services are currently accredited for bulk asbestos analysis by the National Voluntary Laboratory Accreditation Program (NVLAP) of the National Institute of Standards and Technology (NIST). This report may not be used to claim product endorsement by NVLAP or other U.S. Government agency. This report may not be reproduced except in full, without the written approval of NERL. Our NVLAP laboratory code number is 101593-0.

The results given, which pertain only to the materials submitted for testing, are listed in Table 1. Details of this report will not be issued to any person or agency not associated with you or the SSA. The EPA method guidelines were developed for use in evaluating friable materials. Point-count reanalysis of materials is recommended to confirm trace or low-percentage PLM results. If you have questions regarding the content of this report, analytical procedures or methods, asbestos evaluation or abatement, please contact NERL directly at (303) 236-3455 ext 603.
